

PHASE 3: PROJECT DESIGN PHASE

3.1 System Architecture

The project is designed as a data migration workflow in ServiceNow.

Data Flow

The spreadsheet acts as the source of employee information. The Import Set temporarily receives the data, while the Transform Map controls how the source data is transferred to the target Employee Test table.

3.2 Custom Table Design

A custom table named Employee Test is created in ServiceNow.

Table Label: Employee Test

Table Name: u_employee_test

The table contains the following fields:

Field	Type
Employee ID	String
Employee Name	String
Email	String
Department	String
Location	String

3.3 Import Set Design

An Import Set table named Employee Import is created to receive the spreadsheet data.

Label: Employee Import

Name: u_employee_import

The Import Set acts as the staging area before the data is transformed into the target table.

3.4 Transform Map Design

A Transform Map named Sample Spreadsheet Import is created.

Source Table: Employee Import

Target Table: Employee Test

The source fields and target fields are mapped using Auto Map Matching Fields and Mapping Assist.
