

PHASE 5: PROJECT DEVELOPMENT PHASE

5.1 Preparing the Spreadsheet

A Google Spreadsheet is created with sample employee data. The spreadsheet contains employee information such as Employee ID, Name, Email, Department, and Location.

The spreadsheet is then downloaded in .xlsx format so that it can be imported into ServiceNow.

5.2 Creating the Employee Test Table

A custom table named Employee Test is created in ServiceNow.

The required fields are added:

- Employee ID
- Employee Name
- Email
- Department
- Location

These fields are configured as String fields.

5.3 Creating the Import Set

The Employee Import Import Set table is created using the Load Data functionality.

The spreadsheet data is loaded into this table, which acts as the staging area for the transformation process.

5.4 Creating the Transform Map

A Transform Map named Sample Spreadsheet Import is created.

The source and target tables are configured as:

- Source: Employee Import
- Target: Employee Test

The source and target fields are mapped using Auto Map Matching Fields and Mapping Assist.

5.5 Transforming the Data

After completing the field mapping, the Transform option is selected and the transformation is executed.

After the transformation, the imported records are checked in the Employee Test table.
