Project Name	Import Data using Transform Maps (Spreadsheet)

Import Data using Transform Maps (Spreadsheet)

Project Overview

This project focuses on importing structured employee data from an external spreadsheet into the ServiceNow platform using Import Sets and Transform Maps. The project simulates a real-world scenario where employee data is maintained in Excel format and needs to be migrated into ServiceNow efficiently and accurately.

The spreadsheet data is first loaded into an Import Set table, which acts as a staging area. A Transform Map is then configured to map the source fields to the appropriate fields in the target Employee Test table. After the transformation is executed, the records are created or updated in the target table. The project also uses Coalesce to prevent duplicate records and includes Reports and Dashboards for better visibility of employee information.

PHASE 1: BRAINSTORMING & IDEATION PHASE

1.1 Identification of the Problem

In an organization, employee information may be maintained in external spreadsheet files. Manually entering a large number of employee records into ServiceNow can be time-consuming and may result in data-entry errors.

Therefore, a method is required to transfer employee information from a spreadsheet into ServiceNow in a structured and efficient manner.

1.2 Proposed Idea

The proposed project uses the ServiceNow Import Set and Transform Map functionality to import employee data from an Excel spreadsheet into a ServiceNow table.

The basic idea is:

Excel Spreadsheet → Import Set → Transform Map → Employee Test Table

This approach provides a structured way to load, transform, and validate employee information.

1.3 Project Objective

- To import employee data from an external spreadsheet into ServiceNow.
- To create a custom table for storing employee information.
- To configure an Import Set for loading spreadsheet data.
- To create and configure a Transform Map.
- To map source fields to target fields.
- To transform and validate the imported records.
- To prevent duplicate records using Coalesce.
- To create reports based on employee information.
- To display the reports through an Employee Analytics Dashboard.

The project ultimately provides an end-to-end understanding of the employee data import process in ServiceNow.
